

OFFICIAL IDEA SUBMISSION DOSSIER // SIH26105

Problem Statement ID:	SIH26105
Problem Statement Title:	AI-Powered Continuous Cyber Risk Quantification & Investment Optimization Platform
Theme:	Blockchain & Cybersecurity
Category:	Software
Team ID:	180219
Team Name:	ByteForce_1
Team Leader:	Aryan Baghel
Team Members:	Kirti, Hitesh Chauhan, Avinav Jha, Sharim Khan, Aman Sekh
College / Institute:	Skyline Institute of Engineering and Technology, Greater Noida, Uttar Pradesh
Ministry / Org:	AICTE (Cyber Security Cell) & MIC

Real-World Issue

Enterprises rely on static, qualitative 'High/Medium/Low' heatmaps that hide actual financial exposure, leaving boards unable to justify cyber budgets against dynamic threats.

Why Important

Cyber incidents cost Indian enterprises ₹25,000+ Cr annually. 68% of CISOs struggle to defend security ROI to corporate boards without quantified financial risk metrics.

Proposed Solution: AURA Sentinel

AI-powered continuous cyber risk quantification unifying the Open Group FAIR standard, Monte Carlo simulation, 0/1 Knapsack optimization, and SHA-256 Merkle blockchain.

- Live SOC Console
- GitHub Repo
- REST API Docs

AURA CYBER DEFENSE MATURITY PYRAMID

RISK: Static Annual Heatmaps

Subjective High/Medium guesswork; stale within days; zero actuarial Rupee quantification.

vs

SOLUTION: Continuous FAIR Engine

Automated continuous loss calculation (Threat Frequency × Loss Magnitude in ₹).

RISK: Arbitrary Budget Guesswork

Security budgets allocated via vendor hype & panic; no mathematical ROI justification.

vs

SOLUTION: 0/1 Knapsack Optimizer

Bounded dynamic programming maximizes risk reduction per Rupee invested.

RISK: Repudiable Audit Trails

Editable database logs that fail rigorous regulatory scrutiny (DPDP & CERT-In).

vs

SOLUTION: Merkle Blockchain Ledger

Cryptographically sealed SHA-256 state anchoring for zero-trust compliance.

• Lifecycle Specification

• Algorithm Proofs

TECHNOLOGIES USED

• Backend & APIs

Python 3.10, FastAPI, Pydantic, Uvicorn, SQLite 3

• Quantification Engine

Open Group FAIR (O-RT), NumPy, Monte Carlo (10k)

• Optimization Logic

0/1 Knapsack (Dynamic Programming), Multi-Constraint

• Blockchain & Audit

SHA-256 Merkle Tree, Cryptographic Hash Chain

• Frontend & SOC UI

React 18, Tailwind CSS, Lucide Icons, Recharts

FEASIBILITY ANALYSIS

❑ Plug-and-Play Ingestion

Seamlessly connects with existing tools (Nessus, Qualys, AWS, Active Directory) via standard REST APIs without hardware changes.

❑ Sub-Second Computation

10,000 Monte Carlo runs execute in <850ms in pure NumPy; dynamic programming knapsack completes in <50ms.

❑ Modular Microservices

Dockerized, container-ready architecture allows independent scaling of analytics workers and telemetry listeners.

❑ Agentless Deployment

Zero endpoint installation required, drastically reducing IT friction and operational overhead.

VIABILITY & GOVERNANCE

❑ Global Actuarial Standards

Built strictly on Open Group FAIR & NIST SP 800-30 Rev 1, accepted by boards and cyber insurers globally.

❑ Regulatory Compliance

Merkle audit proofs satisfy DPDP Act 2023, RBI Cyber Security Framework, and CERT-In logging directives.

❑ Boardroom Defensibility

Converts ambiguous technical CVSS scores into CFO-ready ₹ Rupee loss distributions and justified ROI.

❑ Zero Vendor Lock-In

Open JSON/CSV data schemas and open-standards compliance ensure transparent, portable risk registers.

BUSINESS POTENTIAL & ROI

❑ 70%+ Audit Cost Reduction

Automates manual third-party cyber risk assessments, saving ₹20L–₹50L per annual enterprise audit cycle.

❑ Optimized Security Spend

Dynamic knapsack allocation prevents overspending on low-impact controls, saving 25–40% of security budget.

❑ Enterprise Market Scale

Targeted at BFSI, Healthcare, Critical Infrastructure, and IT enterprises needing continuous compliance.

❑ Cyber Insurance Alignment

Empirical Value-at-Risk modeling accelerates policy underwriting and lowers corporate insurance premiums.

AURA SENTINEL // MULTI-DIMENSIONAL IMPACT MATRIX

OPERATIONAL ADVANTAGES

- **24/7 Continuous Visibility**
Replaces periodic static audits with real-time dynamic risk quantification.
- **Optimal Budget ROI**
Knapsack algorithm maximizes security risk reduction per Rupee invested.
- **Impact Remediation**
Fixes vulnerabilities based on financial loss risk rather than CVSS noise alone.
- **Cryptographic Audit**
Tamper-proof Merkle ledger guarantees verifiable non-repudiation.

STRATEGIC & REGULATORY PILLARS

- **Boardroom Financial Clarity**
Translates cyber exposure into Value-at-Risk (₹ Crores) for executive consensus.
- **Compliance Readiness**
Automates reporting for DPDP Act 2023, RBI Cyber Guidelines, & CERT-In.
- **Cyber Insurance Underwriting**
Provides empirical loss exceedance curves required for favorable policy rates.
- **Unified C-Suite Vocabulary**
Bridges the technical communication gap between SOC analysts and CFO/Board.

▣ Paradigm Shift: From Subjective Guesswork to Actuarial Financial Precision ▣
